

Development of technical and financial norms and standards for drainage of irrigated lands

The project focused on acquiring, synthesizing and transferring contemporary knowledge on drainage (surface and subsurface) in South Africa, as described in the specific objectives. The project will be managed by a core team (two or three people) who will be responsible for collating data and report-writing, backed up by a team of specialist consultants and Departments from the collaborating organisations that will provide inputs as and when required. At least two students will be involved at any time during the project.
